Barry EM; Altboum Z, Levine MM,

WPI; 2002-049280/06. N-PSDB; AAI70763, AAI70780.

New nucleotide sequence, useful as immunogenic agent for generating immune response against recombinant product of the operon, comprises csa operon which encodes enterotoxigenic Escherichia coli-CS4 pili.

Claim 10; Page 59; 81pp; English.

The present sequence is that of the tip associated protein CsaE of enterotoxigenic Escherichia coli (ETEC) strain Ell881A. CsaE is encoded by the csaE gene (see AAI70763) of the E. coli El1881A csa operon. This operon includes 5 contiguous genes, csaA-csaE, which encode the synthesis of ETEC-C84 pili. It has been expressed in attenuated Shigella strain CVD1204 guaBA, constructing the Shigella expressing CS4 fimbriae vaccine

The invention relates to an isolated nucleotide sequence comprising a csa operon (encoding proteins required for producing CS4 pii) or its functional fragment. An immunogenic composition comprising a recombinant product of a csa operon and a carrier, is useful for generating an immune composition. The recombinant product of the composition is the CS4 antigen (bacterial pill protein) and is provided in an acellular or cellular composition. The nucleic acid is useful for producing a conception. The nucleic acid is useful for producing a collupar composition. The nucleic acid is useful for producing a collupar composition in the nucleic acid is useful for producing a collupar composition without a recombinant host cell is produced and involves providing a nucleic acid, introducing the csa operon in an expression vector, such that a recombinant host cell is produced and completing the csa operon is expressed. The nucleic acid encoding at least an immunogenic portion of the csa operon or a polypeptide encoded by the immunogenic portion of the csa operon or a polypeptide encoded by the concellular acid is useful for generating an immune response in a vertebrate against ETBC (enterctoxigenic Escherichia colli is also useful for generating an immune response in a vertebrate cateful for identifying polynucleotides encoding other proteins with biological functions similar to that of the csa operon and for creating a multiveal caused by either Shigella or CS4 expressing ETBC strains. This sequence represents a recombinant product of a csa operon, CSBE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

Novel isolated nucleic acid comprising csa operon encoding proteins required for producing CS4 pili, useful for generating immune response in vertebrate against the enterotoxigenic Escherichia coli.

Disclosure; Page 35-41; 58pp; English.

The invention relates to an isolated nucleotide sequence comprising a csa operon (encoding proteins required for producing CS4 piil) or its functional fragment. An immunogenic composition comprising a recombinant product of a csa operon and a carrier, is useful for generating an immune response in a subject, which involves contacting the subject with the immunogenic composition. The recombinant product of the composition is the CS4 antigen (bacterial pill protein) and is provided in an accilular or cellular composition. The mucleic acid is useful for producing a polypeptide product from a csa operon or functional fragment, which involves providing a nucleic acid, introducing the csa operon in an expression vector, such that a recombinant host cell is produced and expression vector, such that a recombinant host cell is produced and expression protein sequence acid, introducing the csa operon in an expression portion of the csa operon or a polypeptide encoded by the immunogenic portion of the csa operon or applyeptide encoded by the mucleic acid is useful for identifying polynucleotides encoding other proteins with cuseful for identifying polynucleotides encoding other proteins with a multivalent Shigellae TERC immunogenic composition that will protect from diarrhoea caused by either Shigella or CS4 expressing BTEC strains. This sequence represents a csa operon related protein of the invention

Isolated nucleic acids encoding Escherichia coli CS2 pilin proteins useful for vaccinating against diarrheal diseases caused by Escherichia 

45-48; 35pp; English. Claim 3; Col

This sequence represents a CS2 pilin protein of the invention, encoded by (which also encodes CotA, CotC, and CotB). CS2 pilins are long proteinaceous molecules thought to mediate attachment of enterotoxigenic B. coli (ETRC) to and/or promote colonisation of the human upper intestine. The CS2 gene cluster may be used to produce immunogens for vaccinating patients against diarrhoeal diseases caused by ETBC bacteria. This type of enteric infection is a major cause of death among infants in Deficiency Syndrome (AIDS)) or elderly adults. The vaccine comprises more than 1 antigenic determinant (epitopes) from more than 1 pilus type to be effective against more than 1 type of ETBC infection

```

a DNA sequence of a gene encoding the precursor of the saf finabriae unit of Salmonella enterica subspecies 1 or a DNA sequence of the gene encoding the precursor of the saf finabriae unit of S. enterica subspecies 1 servar Typhi The products of the invention can be used as vaccines or for gene therapy. Such vaccines are useful for protection against diseases caused by S. enterica subspecies I servar Typhi. The saf and tof proteins from S. enterica subspecies I servar Typhi. Useful for active or passive immunization in mammals. The nucleotide sequences are useful for constructing vectors for use as vaccines for insertion into attenuated bacteria in constructing a recombinant viral vaccine, or for direct inoculation of a nucleic acid vaccine. The protein or antigenic fragments, nucleic acid sequences, and antibodies are useful in molecular diagnostic assays for the detection of S. enterica

This invention describes the novel proteins (saf and tcf) (I) encoded by

of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
polypeptide or its fragment whose expression is inhibited by the
contisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
proliferation or the activity of a gene in an operon required for
the gene product or that has an activity against a biological pathway
required for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation, or that that inhibits cellular proliferation;
configuration or the test compound that inhibits proliferation of an agene on which the test compound that inhibits proliferation of an
organism acts; (9) manufacturing an antibiotic; (10) profilling a 1003 | :| :|||:: KGMTDSNGTALASLTGTLAGTHMITARLANSNVSDTQPMTFVADKORAVVULQTSKABII 1063 802 857 910 172 DATLKLRVKRRYSETYGTYTINITIKLTDKGNIQIWLPQFKSDARVDLNLRPTGGGTYIG 231 287 ---NIADAASLETNWNRITAVTMPEISVPVLC 327 113 RELQIKGY-KQLLFKSVNCPSGLTLNSAHFNCNKNAASGASLYLYIPAGELKNLPFGGIW 171 The present sequence is encoded by one of aenes. Note: The sequence data for this compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpresses, (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational 9 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium the target prokaryotic essential genes. This invention describes a novel nucleic acid (NA) encoding a nioctinic acetyl-choline receptor (1) from insects which can be used as an insecticide. Inhibitors of (1) interfere with neurotransanission. (1) also vectors containing it, its regulatory regions, and antibodies directed against (1)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of ACHR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related ACHR in insects. (1) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (11). This sequence represents an acetyl-choline receptor isolated from Drosophila melanogaster

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel polypeptides BASB223 and BASB224, isolated from non-typeable H. influenzae (NTH). The polypeptides are related to H. influenzae high molecular weight protein h. (Hmwh). Compositions comprising the BASBB223 and BASBB224 polypeptides and polynucleotides are useful for preparting a medicament for generating an immune response in an animal. The BASBB223 and BASBB224 polypeptides and polynucleotides may be used as research reagents and materials for discovery of treatments and

The invention relates to novel polypeptides BASB223 and BASB224, isolated from non-typeable H. influenzae (NTH). The polypeptides are related to H. influenzae high molecular weight protein A (HmwA). Compostions comprising the BASBB223 and BASBB224 polypeptides and polynucleotides are useful for preparing a medicament for generating an immune response in an animal. The BASBB223 and BASBB224 polypeptides and polynucleotides may be useful for preparing a medicament for generating an immune response in an animal. The BASBB223 and BASB224 polypeptides and polynucleotides may be used as research reagents and materials for discovery of treatments and diagnosis for diseases, particularly human diseases, and as immunogens polynucleotides. The polynucleotides may be used in the discovery and development of antibacterial compounds, in genetic immunization, in the development of prophylacitic or therapeutic agents for bacterial infection, particularly non-typeable H. influenzae. The present sequence

microbial cell wall. The coding sequence is used in the production of a recombinant polywucleotide which comprises a structural gene encoding a protein with catalytic activity and at least part of a gene encoding at least the C-terminus of a protein capable of anchoring in a eukaryotic or prokaryotic cell wall. The anchoring fragment or protein is selected from alpha agglutinin, AGA, FIO, 1 major cell wall protein of lower eukaryotes or a proteinase of lactic acid bacteria. The recombinant polymucleotide preferably also comprises a sequence encoding a signal peptide to ensure secretion of the expressed product. The signal peptide is preferably derived from glycosyl-phosphatidyl-inositol, anchoring protein, alpha factor, alpha-agglutinin, irvertase or inulinase, alphamicroorganism can be used for performing enzymatic processes on an industrial scale. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conditions a polypeptide whose expression is inhibited by the antisense collypeptide or its fragment whose expression is inhibited by the antisense uncleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cludar proliferation or the activity of a gene in an operon required for proliferation, or that thibits cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that as an activity against a biological pathway in which a proliferation-required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibototic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of organism or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational confired for proliferation to isolate candidate molecules for rational confirmed for proliferation to isolate candidate molecules for this centured or be arruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this preduced in electronic format directly from MIPO at the propersed or centured so the confirmation of the confirmation of the proliferation of the proliferation of the proliferation of the proliferation of the proliferation of the pro 50 ILNNHITAYSESHTLYDRMTF----LCLSSHNTLNGACFTSENPSSSSVSGETNITLQFT 105 -NEKPLSSEKNANOYNTTYP 141 .06 EKRSLIKKRELQIKGYKQLLFKSVNCPSGLTLNSAHFNCNKNAASGASLYLYIPAGELKNL 165 ---KGHSTVLKNIOIGAEOF----NLKNS 183 166 PFGGIWDATLKLRVKRRYSETYGTYTINITIKLTDKGNIQIWLPQFKSDARVDLNLRPTG 225 ----SVQİKAKLİDAA------PLQTAKANINFK--- 209 226 GGTYIGRNSVDMCFYDGYST--NSSSLEIRFQDNNPKSDGKFYLRKINDDTK----EIAY 279 Gaps 116; Indels 107; Length 513; :: DB 6; 6.0%; Score 113.5; Di 21.7%; Pred. The invention relates to the recombinant production of Haemophilus influenzae high molecular weight (HWW) proteins in Bscherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H. Coliminate (WHH): Most HWW-expressing NTH1 strains contain two hmw gene clusters termed hmwLABC and hmwZABC. Each hmwABC operon comprises hmwA, hmwB and hmwC genes encode the structural HWMA proteins of the hmwB and hmwC genes encode accessory proteins which are responsible for post-translational processing and secretion of the HWMA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HWMA. The invention also discloses hmwA genes (AAA52175-A52199) and HWMA proteins (AA301824-800849) from the non-typeable H. influenzae or strains Joyc, KI, KZI, LCDC2, PMH, 15 and 12. The nucleic acids and vectors are used for the production of recombinant H. influenzae HWW proteins which can be used as vaccines to mediate a humoral or cellmediated immune response to provide protection against diseases in humans caused by H. influenzae (e.g., profile against magainst diseases in humans caused by H. influenzae (e.g., profile against Haemophilus, HWM proteins in immunoassays for detecting antibodies against Haemophilus, HWM proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule for producing recombinant high molecular weight proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mediated immune response to provide protection against diseases in himmans caused by H. influenzae (e.g., otitis media, epiglottitis, pneumonia and tracheobronchitis). The HWW proteins are also useful as antigens in immunossays for detecting antibodies against Haemophilus, HWW proteins and/or HWW peptides. The nuclectide sequences encoding the HWW proteins can be used to isolate and clone hmw genes from chier non-typeable strains of Haemophilus via hybridisation reactions. The present sequence represents an HWMA protein from a non-typeable strain of H. influenzae. (Updated on 12-532-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ELAYTLSILLAG---KSLTPTNGTSLNIADAASLETNWNRITAVTMPEISVPVLCWPGRL 332
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   L--NLRPICGGTYIGRNSVDMCFYDGYSTNSSSLEIRFQDNNPKSD-GKFYLRKINDDTK 275
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IGGNISQKEGNJTISSDKINI------TKRIBIKADTDQGNSDSGVASNANLTIKTK 588
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  424
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       119 GYKQLLFKSYNCPSGLTL--NSAHFNCNKNAASGASLYLYIPAGEL-KNLPFGGIW--DA 173
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      477
                                                                                                     The invention relates to the recombinant production of Haemophius influenzae high molecular weight (FRW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in 3. coli (e.g., the T7 promoter) operably linked to a modified hammable operon from a non-typeable (non-encapsulated) if.
                                                                                                                                                                                                           influenzae (WTH1). Most HWW-expressing NTH1 strains contain two hmw gene clusters termed hmw1ABC and hmw2ABC. Bach hmwABC operon comprises hmwA, hmw3 and hmwC genes. The hmwA genes encode the structural HWMA proteins and the hmwB and hmwC genes encode accessory proteins which are responsible for post-translational processing and secretion of the HMWA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HWMA proteins (AABO1824 HO1849) from the non-typeable H. influenzae strains Joyc, KI, KZI, LCDC2, PMHI, 15 and 12. The nucleic acids and vectors are used for the production of recombinant H. influenzae HMW proteins which can be used as vaccines to mediate a humoral or cell-
proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       369 EKNAIFSTHNLTILGGNVTLGGENSSSNIKGNININSKANVILQAHAGTSHLDKKE----

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This protein comprises the high molecular weight surface protein HWW4 (123 kDa) of non-typeable Haemophilus influenzae strain 5 that has the immunological ability to protect against disease caused by a non-typeable Haemophilus strain and is characterised by at least one surface-exposed B cell epitope that is recognised by monolonal antibody ADG. The HWW4 amino acid sequence was deduced from an isolated hww4 gene (see AAM30293). HWW1 (see AAM30294) and HWW3 (see AAM30294) have also been identified. A conjugate comprising HWW4 linked to an antigen, hapten or polysaccharide, and a synthetic peptide of 6-150 amino acids corresponding to at least protective epitope of HWW4 are also claimed. HWW proteins, conjugates and peptides can be used in vaccines, as immunogens for preparation of antibodies and as antigens for detection of these antibodies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The isolation and purification of the high molecular weight protein enables the identification of the major protective epitopes of the protein by conventional epitope mapping. These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines. (Updated on 25-MAR-2003 to correct

probable membrane protein YMR215w - yeast (Gaccharomyces cerevisiae)
N;Alternate names: hypothetical protein YM8261.09
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Accesion: S55097
R;Dedman, K.; Brown, D.; Bowman, S.
Sibilited to the BMBL Data Library, June 1995
A;Accession: S55097
A;Reference number: S55089
A;Accession: S55097
A;References: DNA
A;Residues: 1-524 < DBD>
A;Coss-references: EMBL: Z49809; NID:g854459; PID:g854467; GSPDB:GN00C13; MIPS:YMR215w
A;Experimental source: strain AB972
C;Genetics:
